

Caterina Fede

Since 2008 she has been active in supporting the University teaching of Padua, in particular in the field of Embryology and differentiation (Degree Course in Molecular Biology), of Histology (Degree Course in Molecular Biology) and of Cellular Biology (Degree Course in Molecular Biology and Natural Sciences) - University of Padua. Caterina has published several studies on the cellular and molecular aspects of the fascia.

The main research has been the expression of hormone receptors in the fascial cells, the regulation of the production of extracellular matrix in vitro, depending on the hormonal levels and the quantification of hyaluronic acid in the fascia, and on the characterization of the fasciocytes.
